RESEARCH EXPERIENCE

- 2021-present | PostDoc, CALIFORNIA INSTITUTE OF TECHNOLOGY, United States
Advisor: Prof. Thomas VIDICK
Primarily studied hybrid models where depth bounded quantum circuits, can be interleaved with BPP machines.
Showed oracle separations among the different hybrid models.¹
Characterised quantum depth, relative to a random oracle.²
On the side, worked on quantum foundations and quantum coin flipping.
Motivated by contextuality, demonstrated self-testing of a single quantum system (includes both theory and experiment).³
Introduced methods to improve the security of device-independent weak coin flipping protocols, resulting in an improvement after a decade.⁴
Solutions to Quantum Weak Coin Flipping—collected all our previous results on the topic into a journal version.⁵

Quantum Weak Coin Flipping
Advisor: Prof. Jérémie ROLAND
Primarily worked on quantum weak coin flipping, a cryptographic primitive. Its figure of merit is called the bias, ϵ . The best known had $\epsilon \rightarrow 1/6$ by C. Mochon in 2005.
Protocols with $\epsilon \rightarrow 1/10$ were found¹.
An algorithm to numerically find protocols with $\epsilon \rightarrow 0$ was given¹.
An exact (geometric) solution to the problem was found².
A simpler, exact (algebraic) solution to the problem was found³.
On the side, investigated foundational aspects of quantum mechanics⁴.

Contextuality in a Deterministic Quantum Theory
Advisor: Prof. Arvind
Concluded that contextuality is not a necessary feature of quantum mechanics and proposed an alternative, non functional-consistency, bolstered by an explicit construction.
