## RESEARCH EXPERIENCE

- 2021-present | PostDoc, CALIFORNIA INSTITUTE OF TECHNOLOGY, United States  
Advisor: Prof. Thomas VIDICK  
Primarily studied hybrid models where depth bounded quantum circuits, can be interleaved with BPP machines.  
Showed oracle separations among the different hybrid models.<sup>1</sup>  
Characterised quantum depth, relative to a random oracle.<sup>2</sup>  
On the side, worked on quantum foundations and quantum coin flipping.  
Motivated by contextuality, demonstrated self-testing of a single quantum system (includes both theory and experiment).<sup>3</sup>  
Introduced methods to improve the security of device-independent weak coin flipping protocols, resulting in an improvement after a decade.<sup>4</sup>  
Solutions to Quantum Weak Coin Flipping—collected all our previous results on the topic into a journal version.<sup>5</sup>

*Quantum Weak Coin Flipping*  
Advisor: Prof. Jérémie ROLAND  
Primarily worked on quantum weak coin flipping, a cryptographic primitive. Its figure of merit is called the bias,  $\epsilon$ . The best known had  $\epsilon \rightarrow 1/6$  by C. Mochon in 2005.  
Protocols with  $\epsilon \rightarrow 1/10$  were found<sup>1</sup>.  
An algorithm to numerically find protocols with  $\epsilon \rightarrow 0$  was given<sup>1</sup>.  
An exact (geometric) solution to the problem was found<sup>2</sup>.  
A simpler, exact (algebraic) solution to the problem was found<sup>3</sup>.  
On the side, investigated foundational aspects of quantum mechanics<sup>4</sup>.

*Contextuality in a Deterministic Quantum Theory*  
Advisor: Prof. Arvind  
Concluded that contextuality is not a necessary feature of quantum mechanics and proposed an alternative, non functional-consistency, bolstered by an explicit construction.
